## FUSED POLYCYCLIC 2-AMINOPYRIMIDINE DERIVATIVES AS PROTEIN KINASE INHIBITORS

This invention relates to a series of fused polycyclic 2-aminopyrimidines,  
5 to processes for their preparation, to pharmaceutical compositions containing them, and to their use in medicine.

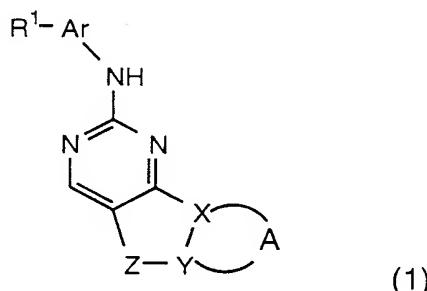

Protein kinases participate in the signalling events which control the activation, growth and differentiation of cells in response to extracellular  
10 mediators and to changes in the environment. In general, these kinases fall into two groups; those which preferentially phosphorylate serine and/or threonine residues and those which preferentially phosphorylate tyrosine residues [Hanks, S K, Hunter T, FASEB. J. 9, 576-596 (1995)]. The serine/threonine kinases include for example, protein kinase C isoforms  
15 [Newton A C, J. Biol. Chem. 270, 28495-28498 (1995)] and a group of cyclin-dependent kinases such as cdc2 [Pines J, Trends in Biochemical Sciences 18, 195-197 (1995)]. The tyrosine kinases include membrane-spanning growth factor receptors such as the epidermal growth factor receptor [Iwashita S and Kobayashi M. Cellular Signalling 4, 123-132  
20 (1992)], and cytosolic non-receptor kinases such as ZAP-70 and csk kinases [Chan C *et al* Ann. Rev. Immunol. 12, 555-592 (1994)]. A particular group of non-receptor tyrosine kinases are a group known as the src family which includes p56<sup>lck</sup> and p59<sup>fyn</sup>. [Kefelas P *et al* International Journal of Biochemistry and Cell Biology 27, 551-563 (1995)].

25 Inappropriately high protein kinase activity has been implicated in many diseases resulting from abnormal cellular function. This might arise either directly or indirectly, for example by failure of the proper control mechanisms for the kinase, related for example to mutation,  
30 overexpression or inappropriate activation of the enzyme; or by over- or underproduction of cytokines or growth factors also participating in the transduction of signal upstream or downstream of the kinase. In all of these instances, selective inhibition of the action of the kinase might be expected to have a beneficial effect.

We have now found a series of fused polycyclic 2-aminopyrimidine derivatives which are potent and selective inhibitors of protein kinases, especially src-family protein kinases. The compounds are thus of use in the prophylaxis and treatment of immune diseases, hyperproliferative 5 disorders and other diseases in which inappropriate protein kinase action is believed to have a role.

Thus according to one aspect of the invention, we provide a compound of formula (1):

- 30

- 35 The compounds of the invention may be prepared by a number of processes as generally described below and more specifically in the Examples hereinafter. In the following process description, the symbols R<sup>1</sup>, Ar, X, Y, Z and A when used in the formulae depicted are to be understood to represent those groups described above in relation to

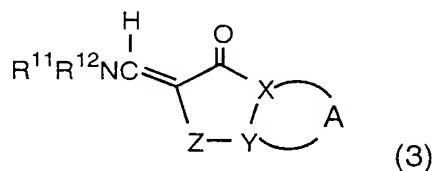

formula (1) unless otherwise indicated. In the reactions described below, it may be necessary to protect reactive functional groups, for example hydroxy, amino, thio or carboxy groups, where these are desired in the final product, to avoid their unwanted participation in the reactions.

5 Conventional protecting groups may be used in accordance with standard practice [see, for example, Green, T. W. in "Protective Groups in Organic Synthesis", John Wiley and Sons, 1991]. In some instances, deprotection may be the final step in the synthesis of a compound of formula (1) and the processes according to the invention described hereinafter are to be  
10 understood to extend to such removal of protecting groups.

Thus according to a further aspect of the invention, a compound of formula (1) may be prepared by reaction of a guanidine of formula (2):

15 or a salt thereof  
with an enaminone of formula (3):

20 where  $\text{R}^{11}$  and  $\text{R}^{12}$ , which may be the same or different is each a C<sub>1-6</sub> alkyl group.

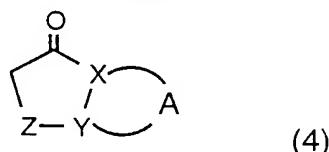

25 The reaction may be performed in a solvent, for example a protic solvent such as an alcohol, e.g. ethanol, methoxyethanol or propanol, optionally in the presence of a base e.g. an alkali metal base, such as sodium hydroxide or potassium carbonate, at an elevated temperature, e.g. the reflux temperature.

Salts of the compounds of formula (2) include acid salts such as inorganic acid salts e.g. hydrochlorides or nitrates.

Intermediate guanidines of formula (2) may be prepared by reaction of the corresponding amine  $R^1ArNH_2$  with cyanamide at an elevated temperature. The reaction may be performed in a solvent such as ethanol at an elevated temperature, e.g. up to the reflux temperature. Where it is desired to obtain a salt of a guanidine of formula (2), the reaction may be performed in the presence of a concentrated acid, e.g. hydrochloric or nitric acid.

The amines  $R^1ArNH_2$  are either known compounds or may be obtained by conventional procedures, for example by hydrogenation of the corresponding nitro derivatives using for example hydrogen in the presence of a metal catalyst in a suitable solvent, for example as more particularly described in the interconversion reactions discussed below. The derivatives  $R^1ArNO_2$  for this particular reaction are either known compounds or may be prepared from known nitro derivatives using for example alkylation and other standard substitution reactions as described in the interconversion reactions hereinafter.

Intermediate enaminones of formula (3) are either known compounds or may be prepared by reaction of a ketone of formula (4):

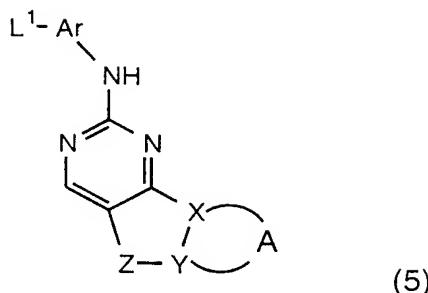

25

with an acetal  $(R^{11})(R^{12})NCH(OCH_3)_2$  at an elevated temperature. The starting materials for this reaction are either known compounds or may be prepared by methods analogous to those used for the preparation of the known compounds.

30

In another process according to the invention, a compound of formula (1) wherein  $R^1$  is a group  $-L^1AlkR^3$  where  $L^1$  is a linker atom or group may be prepared by alkylation of an intermediate of formula (5):

with a compound  $R^3AlkL$  where L is a leaving atom or group.

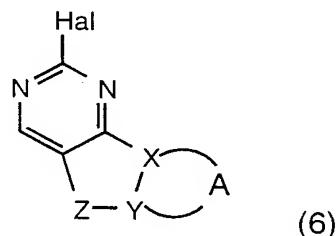

5 Particular leaving atoms or groups represented by L include for example halogen atoms, e.g. bromine, iodine or chlorine atoms, and sulphonyloxy groups, e.g. alkylsulphonyloxy groups, such as trifluoromethylsulphonyloxy, and arylsulphonyloxy groups, such as p-toluenesulphonyloxy.

10

The alkylation reaction may be carried out in the presence of a base, e.g. an inorganic base such as a carbonate, e.g. caesium or potassium carbonate, an alkoxide, e.g. potassium t-butoxide, or a hydride, e.g. sodium hydride, in a dipolar aprotic solvent such as an amide, e.g. a substituted amide such as a dimethylformamide or an ether, e.g. a cyclic ether such as tetrahydrofuran, at around 0°C to around 100°C.

15 Intermediates of formula (5) may be prepared by reaction of an amine  $L^1ArNH_2$  with a compound of formula (6):

20

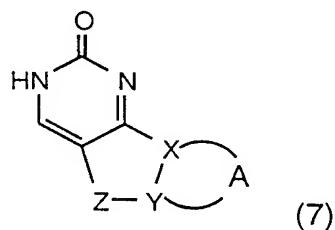

where Hal is a halogen atom such as a chlorine atom.

25 The reaction may be performed at an elevated temperature, for example the reflux temperature, where necessary in the presence of a solvent, for

example a ketone such as acetone, an alcohol such as ethanol or 2-ethoxyethanol or an aromatic hydrocarbon such as toluene, optionally in the presence of a base, for example an organic amine such as triethylamine or pyridine, or an acid, for example an inorganic acid such as 5 hydrochloric acid.

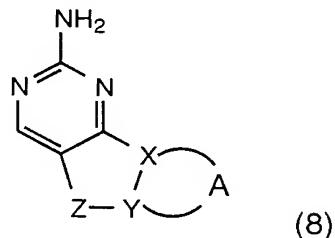

The intermediates of formula (6) may be prepared by heating the corresponding ketones of formula (7):

10

with a phosphorous oxyhalide in a solvent such as dimethylformamide at an elevated temperature such as the reflux temperature.

15 Ketones of formula (7) may be obtained from the corresponding amines of formula (8):

20 by reaction with a nitrite, e.g. sodium nitrite in an aqueous acidic solution followed by treatment with a base, for example an inorganic base such as sodium hydroxide.

25 Amines of formula (8) may be prepared by reaction of an enaminone of formula (3) with guanidine or a salt thereof using the reaction conditions described above for the preparation of compounds of formula (1) from compounds of formula (3).

Intermediates of formulae  $R^3AlkL$  and  $L^1ArNH_2$  for use in the above reactions are either known readily available compounds or may be prepared by methods analogous to those used for the preparation of the known compounds.

5

In a further process according to the invention a compound of formula (1) may be prepared by displacement of the halogen atom in a compound of formula (6) with a compound of formula  $R^1ArNH_2$  using the reagents and conditions described above for the preparation of intermediates of formula

10 (5). The compounds of formula  $R^1ArNH_2$  are either known or may be obtained by conventional procedures, for example by hydrogenation of the corresponding nitro derivatives using for example hydrogen in the presence of a metal catalyst for example as more particularly described in the interconversion reactions and Examples described below. The nitro derivatives are either readily available or may be obtained by manipulation of known nitro derivatives using for example alkylation and other standard substitution reactions described below and in the Examples.

20 In another example of a displacement reaction, a compound according to the invention in which  $R^1$  is a  $-L^1AlkR^3$  group and  $R^3$  is a heterocyclic amino group attached to the remainder of the molecule through its nitrogen atom may be prepared by treating a corresponding compound in which  $R^1$  is a  $-L^1AlkL$  group [where  $L$  is a leaving atom or group as described previously], with an amine  $R^{3a}NH$  [where  $R^{3a}N$  is an optionally 25 substituted heterocycloaliphatic group  $R^3$  containing at least one nitrogen atom]. The reaction may be carried out in a solvent, for example an amide such as dimethylformamide, optionally in the presence of a base, for example an organic amine such as pyridine, at an elevated temperature such as the reflux temperature. The polycyclic starting material for use in 30 this reaction may be obtained by utilising any of the methods described herein, for example by alkylation of an intermediate of formula (5) with a compound  $AlkL$  or a precursor thereto.

35 Compounds of formula (1) may also be prepared by interconversion of other compounds of formula (1) and it is to be understood that the invention extends to such interconversion processes. Thus, for example,

standard substitution approaches employing for example alkylation, arylation, acylation, thioacylation, sulphonylation, formylation or coupling reactions may be used to add new substituents to and/or extend existing substituents in compounds of formula (1). Alternatively existing 5 substituents in compounds of formula (1) may be modified by for example oxidation, reduction or cleavage reactions to yield other compounds of formula (1).

10 The following describes in general terms a number of approaches which can be employed to modify existing Ar and aromatic or heteroaromatic groups represented by groups X, Y and A together in compounds of formula (1). It will be appreciated that each of these reactions will only be possible where one or more appropriate functional groups exist in the compound of formula (1).

15 Thus, for example alkylation or arylation of a compound of formula (1), for example to introduce a group -Alk<sup>1</sup>(R<sup>8</sup>)<sub>n</sub> or R<sup>8</sup> where R<sup>8</sup> is an aryl group may be achieved by reaction of the compound with a reagent (R<sup>8</sup>)<sub>n</sub>Alk<sup>1</sup>L or R<sup>8</sup>L, where L is a leaving group as described above. The alkylation or 20 arylation reaction may be carried out as described previously in relation to the alkylation of intermediates of formula (5).

25 In another general example of an interconversion process, a compound of formula (1) may be acylated or thioacylated, for example to introduce a group -C(O)R<sup>9</sup> or -C(S)R<sup>9</sup>. The reaction may be performed for example with an acyl or thioacyl halide or anhydride in the presence of a base, such as an organic amine e.g. triethylamine or pyridine in a solvent such as an aromatic or halogenated hydrocarbon, e.g. toluene, optionally in the presence of a catalyst, e.g. dimethylaminopyridine dichloromethane at for 30 example ambient up to the reflux temperature, or by reaction with a thioester in an inert solvent such as tetrahydrofuran at a low temperature such as around 0°C.

35 Compounds of formula (1) may be prepared in another general interconversion reaction by sulphonylation, for example by reaction of the compound with a reagent R<sup>9</sup>S(O)L or R<sup>9</sup>SO<sub>2</sub>L where L is a leaving group

as described above in the presence of a base, for example an inorganic base such as sodium hydride in a solvent such as an amide, e.g. a substituted amide such as dimethylformamide at for example ambient temperature. The reaction may in particular be performed with 5 compounds of formula (1) in which Ar and/or X, Y and A together possesses a primary or secondary amino group.

In further examples of interconversion reactions according to the invention 10 compounds of formula (1) may be prepared from other compounds of formula (1) by modification of existing functional groups in the latter.

Thus in one example, ester groups  $-\text{CO}_2\text{Alk}^2$  in compounds of formula (1) may be converted to the corresponding acid  $-\text{CO}_2\text{H}$  by acid- or base-catalysed hydrolysis depending on the nature of the group  $\text{Alk}^2$ . Acid- or 15 base-catalysed hydrolysis may be achieved for example by treatment with an organic or inorganic acid, e.g. trifluoroacetic acid in an aqueous solvent or a mineral acid such as hydrochloric acid in a solvent such as dioxan or an alkali metal hydroxide, e.g. lithium hydroxide in an aqueous alcohol, e.g. aqueous methanol.

20

In a second example,  $-\text{OR}^9$  [where  $\text{R}^9$  represents an alkyl group such as methyl group] groups in compounds of formula (1) may be cleaved to the corresponding alcohol  $-\text{OH}$  by reaction with boron tribromide in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane at a low 25 temperature, e.g. around  $-78^\circ\text{C}$ .

In another example, alcohol  $-\text{OH}$  groups in compounds of formula (1) may be converted to a corresponding  $-\text{OR}^9$  group by coupling with a reagent  $\text{R}^9\text{OH}$  in a solvent such as tetrahydrofuran in the presence of a phosphine, 30 e.g. triphenylphosphine and an activator such as diethyl-, diisopropyl-, or dimethylazodicarboxylate.

Aminosulphonylamino  $-\text{NHSO}_2\text{NH}_2$  groups in compounds of formula (1) may be obtained, in another example, by reaction of a corresponding 35 amine  $-\text{NH}_2$  with sulphamide in the presence of an organic base such as pyridine at an elevated temperature, e.g. the reflux temperature.

In another example of an interconversion reaction, amine (-NH<sub>2</sub>) groups may be alkylated using a reductive alkylation process employing an aldehyde and a borohydride, for example sodium triacetoxyborohydride or

5 sodium cyanoborohydride, in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane, a ketone such as acetone, or an alcohol, e.g. ethanol, where necessary in the presence of an acid such as acetic acid at around ambient temperature.

10 In a further example, amine [-NH<sub>2</sub>] groups in compounds of formula (1) may be obtained by hydrolysis from a corresponding imide by reaction with hydrazine in a solvent such as an alcohol, e.g. ethanol at ambient temperature.

15 In another example, a nitro [-NO<sub>2</sub>] group may be reduced to an amine [-NH<sub>2</sub>], for example by catalytic hydrogenation using for example hydrogen in the presence of a metal catalyst, for example palladium on a support such as carbon in a solvent such as an ether, e.g. tetrahydrofuran or an alcohol e.g. methanol, or by chemical reduction using for example a metal, e.g. tin or iron, in the presence of an acid such as hydrochloric acid.

20

In a further example, amide [-CONHR<sup>9</sup>] groups in compounds of formula (1) may be obtained by coupling a corresponding acid [-CO<sub>2</sub>H] or an active derivative thereof, e.g. an acid anhydride, ester, imide or halide,

25 with an amine R<sup>9</sup>NH<sub>2</sub>. The reaction may also be used to obtain compounds of formula (1) in which R<sup>1</sup> is a -COR<sup>3</sup> group [where R<sup>3</sup> is an optionally substituted heterocycloaliphatic group containing at least one nitrogen atom connected to the group -CO-] by reaction of the corresponding acid in which R<sup>1</sup> is -CO<sub>2</sub>H or an active derivative thereof

30 and an amine R<sup>3a</sup>NH as described above. The coupling reaction may be performed using standard conditions for reactions of this type. Thus for example the reaction may be carried out in a solvent, for example an inert organic solvent such as an amide, e.g. a substituted amide such as dimethylformamide, at a low temperature, e.g. -30°C to ambient

35 temperature, optionally in the presence of a base, e.g. an organic base such as a cyclic amine, e.g. N-methylmorpholine, and where necessary in

the presence of a condensing agent, for example a diimide such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide, advantageously in the presence of a catalyst such as a N-hydroxytriazole, e.g. 1-hydroxybenzotriazole.

5

Aromatic halogen substituents in compounds of the invention may be subjected to halogen-metal exchange with a base, for example a lithium base such as n-butyl or t-butyl lithium, optionally at a low temperature, e.g. around -78°C, in a solvent such as tetrahydrofuran and then quenched with an electrophile to introduce a desired substituent. Thus, for example, a formyl group may be introduced by using dimethylformamide as the electrophile; a thiomethyl group may be introduced by using dimethyldisulphide as the electrophile.

10

In another example, sulphur atoms in compounds of the invention, for example when present in the linker group Z, may be oxidised to the corresponding sulphoxide using an oxidising agent such as a peroxy acid, e.g. 3-chloroperoxybenzoic acid, in an inert solvent such as a halogenated hydrocarbon, e.g. dichloromethane, at around ambient temperature.

15

In a still further example, compounds of the invention may be prepared by aromatisation of a corresponding hydroaromatic compound. Thus, for example, a compound of formula (1) wherein the linker group Z is a -CH<sub>2</sub>-CH<sub>2</sub>- chain may be treated with a hydrogen acceptor, for example a quinone such as 2,3-dichloro-5,6-dicyano-1,4-benzoquinone in a solvent such as an ether, e.g. a cyclic ether such as dioxane, at an elevated temperature, e.g. the reflux temperature, to yield a corresponding compound in which Z is a -CH=CH- chain.

20

In a further example of an interconversion reaction, a compound of the invention containing a substituent R<sup>7</sup> in which R<sup>7</sup> is an aryl or heteroaryl group may be prepared by coupling a corresponding compound in which the R<sup>7</sup> substituent is a halogen atom such as a bromine atom, with a boronic acid Ar<sup>1</sup>B(OH)<sub>2</sub> [in which Ar<sup>1</sup> is an aryl or heteroaryl group as defined above for Ar] in the presence of a complex metal catalyst. Suitable catalysts include heavy metal catalysts, for example palladium

catalysts such as tetrakis(triphenylphosphine) palladium. The reaction may be performed in an inert organic solvent, for example an ether such as dimethoxyethane, in the presence of a base, e.g. an alkali carbonate such as sodium carbonate, at an elevated temperature, e.g. the reflux 5 temperature.

N-oxides of compounds of formula (1) may be prepared for example by oxidation of the corresponding nitrogen base using an oxidising agent such as hydrogen peroxide in the presence of an acid such as acetic acid, 10 at an elevated temperature, for example around 70°C to 80°C, or alternatively by reaction with a peracid such as peracetic acid in a solvent, e.g. dichloromethane, at ambient temperature.

The following Examples illustrate the invention.

All temperatures are in °C. The following abbreviations are used:

THF - tetrahydrofuran; DMF - dimethylformamide;  
DMSO - dimethylsulphoxide; HOBT - 1-hydroxy-7-azabenzotriazole;  
EDC - 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride;

### BIOLOGICAL ACTIVITY

The following assays were used to demonstrate the activity and selectivity of compounds according to the invention. Enzymes for the assays were either obtained commercially or purified from known natural or 5 recombinant sources using conventional methods.

#### p56<sup>lck</sup> kinase assay

The tyrosine kinase activity of p56<sup>lck</sup> was determined using a RR-src peptide (RRLIEDNEYTARG) and [ $\gamma$ -<sup>33</sup>P]ATP as substrates. Quantitation 10 of the <sup>33</sup>P-phosphorylated peptide formed by the action of p56<sup>lck</sup> was achieved using an adaption of the method of Geissler *et al* (J. Biol. Chem. (1990) 265, 22255-22261).

All assays were performed in 20mM HEPES pH 7.5 containing 10mM 15 MgCl<sub>2</sub>, 10mM MnCl<sub>2</sub>, 0.05% Brij, 1 $\mu$ M ATP (0.5 $\mu$ Ci[ $\gamma$ -<sup>33</sup>P]ATP) and 0.8mg/ml RR-src. Inhibitors in dimethylsulphoxide (DMSO) were added such that the final concentration of DMSO did not exceed 1%, and enzyme 20 such that the consumption of ATP was less than 10%. After incubation at 30°C for 15min, the reaction was terminated by the addition of one-third volume of stop reagent (0.25mM EDTA and 33mM ATP in dH<sub>2</sub>O). A 15 $\mu$ l aliquot was removed, spotted onto a P-30 filtermat (Wallac, Milton Keynes, 25 UK), and washed sequentially with 1% acetic acid and dH<sub>2</sub>O to remove ATP. The bound <sup>33</sup>P-RR-src was quantitated by scintillation counting of the filtermat in a Betaplate scintillation counter (Wallac, Milton Keynes, UK) after addition of Meltilex scintillant (Wallac, Milton Keynes, UK).

The dpm obtained, being directly proportional to the amount of <sup>33</sup>P-RR-src produced by p56<sup>lck</sup>, were used to determine the IC<sub>50</sub> for each compound. The IC<sub>50</sub> was defined as the concentration of compound required to 30 reduce the production of <sup>33</sup>P-RR-src by 50%.

In this assay, compounds according to the invention have IC<sub>50</sub> values of around 100nM or less.

**p59<sup>fyn</sup> kinase assay**

Compounds of the invention were assayed for p59<sup>fyn</sup> inhibitory activity in a similar manner to the p56<sup>lck</sup> assay using human p59<sup>fyn</sup>.

5 The selectivity of compounds according to the invention can be determined in an assay utilising a serine/threonine kinase:

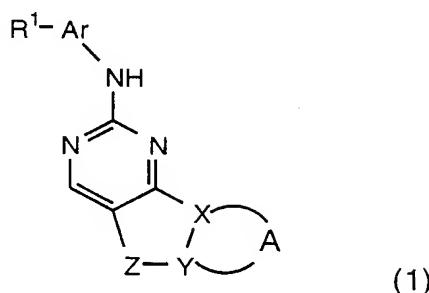

**Protein kinase C assay**

Inhibitor activity against protein kinase C (PKC) was determined using PKC 10 obtained from Sigma Chemical Company (Poole, UK) and a commercially available assay system (Amersham International plc, Amersham, UK). Briefly, PKC catalyses the transfer of the  $\gamma$ -phosphate ( $^{32}\text{p}$ ) of ATP to the threonine group on a peptide specific for PKC. Phosphorylated peptide is bound to phosphocellulose paper, subsequently quantified by scintillation 15 counting, and IC<sub>50</sub> values determined as described above. In this assay compounds according to the invention have IC<sub>50</sub> values of 1 $\mu\text{M}$  and above.
